

Folio

Own real US stocks from any currency, without ever feeling like you are using crypto.

Sign up with an email. Add money. Say what you want to own in one sentence. Hold real shares of Apple, Nvidia or the S&P 500 in your own name, see them in your own currency, sell whenever you like, and give them to people you love.

Status	Live product in build: on-chain program and web app complete and tested; mainnet launch next
Network	Solana mainnet
Entered in	Stocklana (Solana Foundation) — submissions close 25 September 2026; eligible for Colosseum World's Fair

Most of the world is locked out of the best-performing asset class

US equities have been the most reliable long-term way to build wealth for a century. Yet for most people outside the United States, owning even one share of Apple is harder than it should be:

- **Brokerages don't serve them.** Many countries have no local broker offering US shares, and international brokers demand high minimums, US-style paperwork, or refuse whole regions.
- **Money is hard to move.** Getting local currency into a US account means wires, FX spreads and days of waiting — often costing more than the investment earns in a year.
- **Crypto is the only open door, and it feels hostile.** Tokenized stocks now trade on Solana, but using them means seed phrases, wallet extensions, gas tokens, token addresses and swap screens. Ordinary savers will not do that.
- **Nothing is made for real life.** Brokerage apps show tickers and charts. People think in goals — a child's school fund, a gift for a wedding, “the big tech companies”.

The assets exist. The rails exist. What is missing is a product an ordinary person would actually use.

A consumer brokerage whose blockchain is invisible

Folio is a mobile-first investing app. Under the hood, every share is a real tokenized US stock (xStocks, issued by Backed) held in an on-chain vault owned by the user. On the surface there are no wallets, no seed phrases, no gas and no token addresses — just an account, a balance in your currency, and the companies you own.

The unit of value is the **folio**: a named, personal basket of shares — “Ada's school fund”, “Big tech”, “My S&P 500”. A folio can be kept, locked until a date, handed to someone else, or sent as a gift with a link.

The user's journey

Step	What the user does	What Folio does behind the scenes
1. Sign up	Email, phone, Google or Apple. Nothing to install.	Creates a secure embedded Solana wallet for them (Privy). No seed phrase, no SOL needed — ever.
2. Add money	Sends stablecoins from an exchange or another wallet to their account address.	Accepts USDC, USDT, PYUSD, USDG, USD1, EURC and IDRX. Shows the balance in the user's currency.
3. Buy	Types "Apple, Nvidia and the S&P 500" and an amount — e.g. ₦50,000.	Understands the sentence, prices every company live, shows exactly what they get, then buys it all in one all-or-nothing transaction.
4. Hold	Sees their folios and total value in naira, rupees, reais, euros...	Reads the vault on-chain, applies each stock's live split/dividend multiplier and the market price.
5. Sell	Taps "Sell half".	Withdraws the shares and converts them to USDC in one transaction.
6. Withdraw	Sends money out to an exchange or wallet.	Transfers the stablecoin; Folio pays the network fee.
7. Give	Names a folio, picks a date, shares a link.	Holds the folio in escrow until the recipient opens the link and claims it — even if they have never used crypto.

[A REAL QUOTE FROM THE RUNNING APP \(16 SEP 2026\)](#)

"Apple, Nvidia and the S&P 500" for ₦50,000 → 37.64 USDC, split evenly across three companies: 0.0376 shares of Apple, 0.0583 of Nvidia and 0.0165 of the S&P 500 ETF. Total cost to get in 0.46%. Every fill within 0.7% of market, each with a guaranteed minimum share count.

Core product

Feature	Detail
Email / social sign-up	Embedded wallet created automatically. No extension, no seed phrase, no “connect wallet”.
Zero gas for users	Folio pays every network fee and account deposit. Users never hold or see SOL.
Any-currency display	17 display currencies including NGN, KES, GHS, ZAR, EGP, BRL, MXN, ARS, INR, PKR, IDR, PHP, VND, TRY, EUR, GBP, USD — guessed from the phone's locale.
Stablecoin deposits	Seven stablecoins accepted on Solana, each with a live route into stocks.
Real US shares	Apple, Nvidia, Microsoft, Alphabet, Meta, Amazon, Tesla and the S&P 500 ETF (xStocks).
Describe-to-buy	Name companies or describe a theme (“chip makers, no ads”). Folio shows its interpretation, weights, what it left out and why.
Honest review screen	Per company: cost, share count, fill vs market price, price impact, route, and a guaranteed worst case.
All-or-nothing purchases	Up to three companies bought in one atomic transaction — it lands completely or not at all.
Split & dividend aware	Share counts use each token's live on-chain multiplier, so holdings stay accurate through corporate actions.
Sell to USDC	Sell a quarter, half or all of a holding in one transaction, with a minimum-received guarantee.
Send money out	Withdraw stablecoins to any Solana address, with safeguards against pasting the wrong kind of address.

What makes Folio different

Feature	Detail
Named folios	Baskets with a name and a purpose, not a list of tickers.
Time locks	Lock a folio until a date — a child's 18th birthday, a savings goal. Owned and visible the whole time; only withdrawal waits. Locks can be extended, never shortened.
Gift links	Send a folio to anyone with a link. They see what they received and its value in their currency, sign up in a minute and claim it.
Take-back window	If a gift is never claimed, the sender can recover it after a date they chose.
Direct gifts & transfers	Give a folio straight to an existing account, or hand one on later — its lock travels with it.

Why Folio wins

Feels like a normal app.

Sign up with email, see money in your own currency, tap buy. The blockchain does the work without asking the user to understand it. That is the gap between today's crypto tools and the next hundred million investors.

Open to anyone, from anywhere.

No brokerage account, no US paperwork, no minimums. Anyone who can get stablecoins — which is now possible in almost every country — can own US shares in minutes.

Genuinely self-custodial.

Shares sit in an on-chain vault controlled by the user's own key. Folio cannot move them. If Folio disappeared tomorrow, the shares would still be there and still be the user's.

Cheaper and faster than wiring money abroad.

Seconds instead of days; a fraction of a percent instead of wire fees and FX spreads. Buying ₦50,000 of three companies cost 0.46% in our live test.

24/7 and fractional.

Buy 0.03 of a share on a Sunday night. No market hours, no whole-share minimums.

Built around people, not tickers.

Named baskets, locks and gifts turn investing into something people already do: saving for someone, giving something that grows.

Gifting is a growth engine.

Every gift link brings a new person into the app holding real value on day one — the cheapest, warmest customer acquisition there is.

Honest by design.

Every price is shown next to the market, every purchase has a guaranteed minimum, and the issuer's powers are disclosed on every folio. Trust is the product.

The only chain where this product works today

- **The assets are here.** xStocks for major US companies trade on Solana with real liquidity: \$10,000 of Apple moves the price about 0.1%.
- **Fees small enough to sponsor.** Folio can pay every user's network fee and still run profitably — the foundation of an app that never asks for gas.
- **Atomic multi-company purchases.** Three companies, a new folio and all deposits fit in one sub-second transaction.
- **Stablecoin depth.** Every major dollar stablecoin, plus euro and rupiah stablecoins, routes into stocks.
- **Embedded wallets and aggregation are mature.** Privy for accounts, Jupiter for best-price routing.

Built to fail closed

Area	How Folio protects users and itself
Ownership	Each folio is a program-controlled vault. Only its owner can withdraw, and only after any lock has passed.
Gift links	A link carries a one-time signing key generated in the sender's browser. It never touches Folio's servers and cannot be front-run on-chain.
Emergency pause	Stops new money coming in, but never stops anyone reaching money already in a folio.
Sponsored fees	A co-signer checks every transaction against strict rules and simulates it before paying; anything that would cost Folio more than a small fixed ceiling is refused. 18 attack scenarios tested.
Prices	Every quote is re-checked on the server before signing; if the price moved against the user, the purchase is stopped.
Caps	Per-asset limits on every vault during launch, raised as the product matures.
Testing	20 on-chain program tests run against the real mainnet stock tokens and token program.

WHAT USERS SHOULD KNOW

xStocks are issued by Backed, who can freeze, pause or move the tokens — including out of a Folio vault — as regulated issuers must. Folio says this plainly on every folio. xStocks are not available to US persons, and Folio blocks US access. Folio is an interface and a vault, not a broker or an issuer.

Built, tested, and going live

Component	Status
On-chain vault program (Anchor)	Complete · 20 tests passing · ready to deploy to mainnet
Web app (Next.js, mobile-first)	Complete · production build passing · all screens for the full loop
Sign-up with embedded wallets	Integrated (Privy) · awaiting production app keys
Live pricing and quotes	Working against mainnet today
Fee sponsorship co-signer	Complete · 18/18 rule tests
Mainnet launch	Next: deploy program, register the 8 stocks, fund fees, deploy app, first real purchases

What comes next

Phase	What ships
Launch	Full live loop on mainnet: sign up, deposit, buy, hold, sell, withdraw, gift.
Independent prices	Compare every fill with the real stock price from Pyth (equity feed vs token feed), including weekends.
Cash in	Card and bank on-ramps so users can fund with local money directly, no exchange needed.
Cash out	Off-ramps to local bank accounts and mobile money.
Grow the shelf	More companies and ETFs as tokenized supply grows; baskets larger than three companies.
Habits	Recurring buys, goal tracking, family folios, and gift occasions.

Folio's promise is simple: anyone, anywhere, in any currency, can own a piece of the world's best companies — and give that to someone they love — without ever having to learn how a blockchain works.
